

GRADUATE TESTIMONIALS

Jennifer Sutton
C-Tech Innovation

" I have a Masters Degree in Chemistry and work as a Research Chemist at C-Tech Innovation.

One of the enjoyable things about working at C-Tech is the wide variety of different projects that we work on ranging from initial stage proof of concept trials, to process development and scale up, all of which use a wide range of the skills from my degree. Since working here I have also added to that skill set, learning new and improving existing knowledge of chemical techniques and analytical equipment including HPLC, GCMS and ICP. The research and development projects that I am involved in vary in duration from 6 months to 4 years long, broadening my field of expertise in a number of different technical areas along the way.

Training and personal development is actively encouraged within the company (both internally and externally) and since I started I have gained experience across many fields including project management, proposal writing and presenting at conferences. One appeal of working for C-Tech Innovation is working with large range of project partners across the EU and gaining the understanding of how different companies in different countries operate - and the travel is good too!"
