

GRADUATE TESTIMONIALS

Daniel Shepherd
National Nuclear Laboratory

What did you think when you first joined the NNL?
Initially it was very unfamiliar as like most people I was unaware of the realities of working in the nuclear industry - criticality alarms, radiation protection training etc. I also moved to a new area of the country (Preston) which took a little while to get familiar with. However, I soon got used to things and settled in nicely.

What did you do during the two year development programme?

For the Graduate Development Programme, I first undertook an introduction to the nuclear industry course. This was followed by a number of personal development courses including communication, presentation skills, team-working and time management.

What did you most enjoy during the development programme?

I think that the team project focusing on improving an area of the NNL business was a great idea and while it was hard work, I think what we achieved was really rewarding - I'm still working with the relevant area of the business to help them improve. Presenting to the Executive and then again to the Business Leaders was a great opportunity. Attending the following dinner with the Executive and the Leaders was very enjoyable.

What is your current job role within the NNL?

I am a nuclear fuel engineer in the Fuel technology team and I have had some fantastic opportunities in the two and half years since I joined NNL. I have worked on a number of significant customer projects performing both written and practical work mainly for Sellafield Ltd and Springfields Fuels Ltd.
